Design Justification: Portfolio & Risk Tracker App (Riskfolio)

Our Design

When designing our portfolio and risk tracking application, our main goal was to create a modern, trustworthy, and user friendly experience. Since users will be tracking their real money, accessibility and clarity was important to us.

Color Palette

We decided to go with a "Dark Mode" theme right from the start. We chose a Dark Navy (`#0F172A`) for the main background because it is much easier on the eyes (Younger generation are mosty likely to use the dark mode).
For our primary actions like the "Log In" or "Next" buttons in the risk assessment flow we used a Gold accent color (`#F59E0B`). Gold creates a great contrast against the dark navy and gives a subtle psychological nod to wealth and value. For financial indicators, we strictly followed industry standards: Success Green (`#10B981`) is used only for profits and upward trends, while Danger Red (`#EF4444`) is reserved for losses. This ensures that users immediately understand their portfolio's performance at a glance.

Typography

We chose the "Inter" typeface. In a financial app, the most important elements are the numbers. These modern sans-serif fonts are designed to make digits highly readable and prevent numbers like "1", "7", or "0" from bleeding together on small mobile screens.

Layout and Visual Hierarchy

To avoid overwhelming the user with too much data, we used a card-based layout. For example, on the Main Dashboard, the Total Balance and the Asset Allocation pie chart are placed inside separate, slightly lighter-colored cards. This creates a clear visual hierarchy. We also implemented a fixed bottom navigation bar (Home, Add Asset, Profile) because it allows users to navigate the app easily with just one hand.

Accessibility and User Support

All clickable elements and buttons (like the 3 option cards in the risk test) are designed to be large enough to prevent accidental taps.
